3.1	Installation	7
4	Developers Api	9
4.1	Python Api	9
4.2	C Api	12
	Python Module Index	17

Release v0.10.

phantompy is a BSD Licensed, headless WebKit engine with a powerful pythonic api.

Introduction

This package has two main components:

- C/C++ Library which exposes some portions of the WebKit API from Qt5 (**libphantompy**).
- Python bindings for **libphantompy**

Features

Note: One or more of the listed features are not implemented. And others are only a proof of concept and have a limited API.

- Live DOM access in a pythonic way. (Proof of concept API implemented)
- Totally configurable (currently only limited config options are exposed to Python)
- Access to a frames tree created by a page.
- Access to background requests of one page.

User guide

3.1 Installation

3.1.1 Distribute & Pip

You can install **phantompy** with *pip* (see [C/C++ library installation notes](#)):

```
pip install phantompy
```

3.1.2 Get the Code

Also, you can download the latest version from [github](#) and install it manually:

```
git clone https://github.com/niwibe/phantompy
cd phantompy
python setup.py install
```

3.1.3 Additional notes

C/C++ Library Notes

The core part of **phantompy** is a c/c++ library that uses qt5 for access to WebKit engine (with Qt5WebKit).

Before use of python library/wrapper for libphantompy, you need install system-wide this c/c++ library.

For compile it, you need:

- Gcc \geq 4.8 or clang++ \geq 3.2 (simply not tested with previous versions)
- Qt5 (Core, Network, WebKit, Widgets)
- CMake \geq 2.8.4

Compile and install instructions:

```
cd build
cmake ..
make
sudo make install
```

NOTES:

- This library has limited tested environments. If you can compile in other environments would be helpful if you notified me of it.
- This library does not work properly on OSX, any help is welcome.

Ubuntu instalation notes

I have not been able to install all modules needed by phantompy on ubuntu. Ubuntu sucks. If you get compile, notify me so I can fill this gap with useful information.

Python Compatibility

This python bindings library is build with python3 in mind and has some layer of compatibility with python2.

Developers Api

4.1 Python Api

This is the technical documentation of the python bindins **libphantompy**'s API.

4.1.1 Context & Config

Context class represents a context singleton pointer that contains an instance of a QT application, an interface for some WebKit engine configuration options and some actions (e.g. clear cache memory).

class phantompy.context.Config
WebKit engine configuration interface.

This class should onlu be accessed through *Context* instance and can not be instanciated as is.

This config interface exposes these properties:

- ‘load_images’ (bool)
- ‘javascript’ (bool)
- ‘dns_prefetching’ (bool)
- ‘plugins’ (bool)
- ‘private_browsing’ (bool)
- ‘offline_storage_db’ (bool)
- ‘offline_storage_quota’ (int)
- ‘frame_flattening’ (bool)
- ‘local_storage’ (boo)

And some additional methods:

set_max_pages_in_cache (num)
Set webkit page number to maintain in cache.

set_object_cache_capacity (min_dead_capacity, max_dead, total_capacity)
Set webkit object cache capacity.

class phantompy.context.Context

```
clear_cookies()  
    Clear all cookies.  
  
clear_memory_caches()  
    Clear all memory used by webkit engine.  
  
conf  
    Return a Config instance.  
  
get_all_cookies()  
    Get all available cookies.  
  
process_events(timeout=200)  
    Method like a time.sleep but while waits a timeout process qt events.  
  
set_cookie(name, value, domain, path='/', expires=None)  
    Generic method for set cookie to the cookiejar instance of WebKit Engine.
```

Parameters

- **name** (*str*) – cookie name.
- **value** (*str*) – cookie value.
- **domain** (*str*) – cookie domain.
- **path** (*str*) – cookie path (default ‘/’)
- **path** – cookie expires date (this must be datetime, date, timedelta or str type).

Return type

None

```
set_cookies(cookies)  
    Set a list of cookies.
```

```
phantompy.context.context()  
    Get or create instance of context (singleton).
```

```
phantompy.context.destroy_context()  
    Destroy context singleton instance.
```

4.1.2 Web Element

Live DOM manipulation and transversing api.

```
class phantompy.webelements.WebElement(el_ptr, frame)  
    Class that represents a live dom element on webkit engine.  
  
append(element)  
    Append element or raw html to the current dom element.  
  
    Parameters element – Unicode string with html or WebElement instance.  
  
    Return type None
```

Example:

```
>>> element = p.cssselect("body > section") [0]  
>>> element.append("<span>{0}</span>".format("FOO"))
```

```
append_after(element)  
    Same as append\(\) but appends outside the current dom element.
```

cssselect (*args, **kwargs)

Find all descendent elements by css selector like jQuery.

Parameters `selector (str)` – jQuery like selector

Return type list

cssselect_first (selector)**frame**

Returns a frame instance of this element.

get_attr (name, **kwargs)**getAttrs (*args, **kwargs)**

Get all attributes as python dict. :rtype: dict

get_classes ()

Returs a list of classes that hace current dom element.

Example:

```
>>> element = p.cssselect("section") [0]
>>> element.get_classes()
["main", "main-section"]
```

has_attr (attrname)

Method that checks the existense of one concrete attribute by name.

Parameters `attribute (str)` – attribute name

Return type bool

hasAttrs ()

Method that checkos of existence of any attrs. Returns a True value if a current dom element has any attribute.

Return type bool

has_class (classname)

Method that checks the existense of some class in a current dom element.

Parameters `classname (str)` – class name

Return type bool

Example:

```
>>> element = p.cssselect("section") [0].has_class("foo")
False
```

inner_html ()

Get inner dom structure as html.

Return type str

inner_text ()

Get inner dom structure as text, stripping all html tags.

Return type str

is_none ()

Checks if a current dom element is empty or not.

Return type bool

name

Returns a tagname.

next ()

Get a next element in the same level of dom.

Return type `WebElement`

prev ()

Get a previous element in the same level of dom.

Return type `WebElement`

ptr

Returns a pointer to internal C++ instance object.

remove ()

Remove the current element from the living dom and make this element as empty element.

remove_attr (attrname)

Remove attribute by name.

Parameters `attrname (str)` – attribute name.

Return type None

remove_childs ()

Remove all childs of the current dom.

remove_class (classname)

Method that removes a class from a current dom node. If a class does not exists, this method does nothing.

Parameters `classname (str)` – class name

Return type None

replace (element)

Replace the current element with other.

Parameters `element` – Unicode string with html or `WebElement` instance.

Return type None

set_attr (name, value)

setAttrs (attrs)

wrap (element)

Wraps the current element with other element.

Parameters `element` – Unicode string with html or `WebElement` instance.

Return type None

Example:

```
>>> element = p.cssselect("a") [0]
>>> element.wrap("<div>/</div>")
```

4.2 C Api

This is the technical documentation of the C api, compatible with ctypes. This API is an intermediate layer between the C++ library and Python. The python bindings use this API directly via ctypes.

4.2.1 Context

Context is a singleton object that maintains Qt5 application instance in memory and exposes some QtWebKit configuration options.

The current API is incomplete and in the near future it will expose lots of configuration options for the WebKit engine.

`void* ph_context_init()`

Return type pointer to a Context instance.

This method returns a new Context instance. Context is a singleton, and if you repeatedly call this method, it always returns a pointer to the same object.

`void ph_context_free()`

Destroy a current instance of Context. If you call this method repeatedly, the behavior is unspecified.

`void ph_context_clear_memory_cache()`

Clears the memory used by webkit for the current thread.

`void ph_context_set_object_cache_capacity(int cacheMinDeadCapacity, int cacheMaxDead, int totalCapacity)`

Specifies the capabilities of the memory cache for dead objects such as stylesheets or scripts.

Parameters

- **cacheMinDeadCapacity** (*int*) – specifies the minimum number of bytes that dead objects should consume when the cache is under pressure.
- **cacheMaxDead** (*int*) – is the maximum number of bytes that dead objects should consume when the cache is not under pressure.
- **totalCapacity** (*int*) – specifies the maximum number of bytes that the cache should consume overall.

`void ph_context_set_max_pages_in_cache(int num)`

Sets the maximum number of pages to hold in the memory page cache to pages.

Parameters

- **num** (*int*) – number of pages to hold in the memory.

`char* ph_context_get_all_cookies()`

Returns a cookies array with all the available cookies in a current cookiejar singleton, encoded as JSON.

`void ph_context_set_cookies(const char *cookies)`

Add or overwrite cookies on the current cookiejar.

`void ph_context_clear_cookies()`

Clear all cookies available in a current cookiejar instance.

`void ph_context_set_boolean_config(int key, int value)`

Set WebKit configuration parameter.

`void ph_context_set_int_config(int key, int value)`

Set WebKit configuration parameter.

`int32_t ph_context_get_boolean_config(int key)`

Get WebKit configuration parameter value.

`int32_t ph_context_get_int_config(int key)`

Get WebKit configuration parameter value.

4.2.2 Web Page

This api exposes a **web page** and its frames functionality.

`void* ph_page_create()`

Create a new instance of a Page object and returns its pointer.

Return type pointer to a Page object instance.

`void ph_page_free(void *page)`

Destroy a Page instance and frees the memory used by it.

Parameters

- `page (void*)` – Page instance pointer returned by `ph_page_create()`

`void ph_page_set_viewpoint_size(void *page, int x, int y)`

Set view point size to a page.

`char *ph_page_get_cookies(void *page)`

Get the cookies generated by the page.

`void ph_page_set_initial_cookies(void *page, const char *cookies)`

Set initial cookies to the page.

`int32_t ph_page_load(void *page, char *url)`

Load contents for a current page.

`int32_t ph_page_is_loaded(void *page)`

Checks if the Page is loaded.

`char* ph_page_get_requested_urls(void *page)`

Get a list of URLs requested in background when the page is loaded. The result is encoded as JSON.

`char* ph_page_get_reply_by_url(void *page, const char *url)`

Get downloaded data from one of the background requests.

`void* ph_page_main_frame(void *page)`

Get main frame from Page.

`void ph_frame_free(void *frame)`

Release a frame memory.

`char* ph_frame_to_html(void *frame)`

Get frame content as HTML.

`char* ph_frame_evaluate_javascript(void *frame, char* js)`

Evaluate JavaScript in a current frame and return its result as string.

`void* ph_frame_capture_image(void *frame, const char *format, int quality)`

`void ph_image_free(void *image)`

`int64_t ph_image_get_size(void* image)`

`const char* ph_image_get_format(void* image)`

`void ph_image_get_bytes(void *image, void *buffer, int64_t size)`

`void* ph_frame_find_first(void *frame, const char *selector)`

`void* ph_frame_find_all(void *frame, const char *selector)`

`void* ph_webcollection_get_webelement(void *collection, int32_t index)`

`void* ph_webelement_find_all(void *element, const char *selector)`

```
void* ph_webelement_take_from_document (void *element)
void* ph_webelement_previous (void *element)
void* ph_webelement_next (void *element)
void ph_webcollection_free (void *collection)
void ph_webelement_free (void *element)
char* ph_webelement_tag_name (void *element)
char* ph_webelement_inner_html (void *element)
char* ph_webelement_inner_text (void *element)
char* ph_webelement_get_classes (void *element)
char* ph_webelement_get_attnames (void *element)
char* ph_webelement_get_attr (void *element, const char *attrname)
int32_t ph_webcollection_size (void *collection)
int32_t ph_webelement_has_class (void *element, const char *classname)
int32_t ph_webelement_has_attr (void *element, const char *attrname)
int32_t ph_webelement_hasAttrs (void *element)
int32_t ph_webelement_is_null (void *element)
void ph_webelement_remove_attr (void *element, const char *attrname)
void ph_webelement_add_class (void *element, const char *classname)
void ph_webelement_set_attr (void *element, const char *attrname, const char *value)
void ph_webelement_append_html (void *element, const char *htmldata)
void ph_webelement_append_element (void *element, void *elementement)
void ph_webelement_append_html_after (void *element, const char *htmldata)
void ph_webelement_append_element_after (void *element, void *elementement)
void ph_webelement_replace_with_html (void *element, const char *htmldata)
void ph_webelement_replace_with_element (void *element, void *elementement)
void ph_webelement_remove_all_child_elements (void *element)
void ph_webelement_remove_from_document (void *element)
void ph_webelement_wrap_with_html (void *element, const char *htmldata)
void ph_webelement_wrap_with_element (void *element, void *elementement)
```

p

`phantompy.context`, 9
`phantompy.webelements`, 10

A

append() (phantompy.webelements.WebElement method), 10
append_after() (phantompy.webelements.WebElement method), 10

C

clear_cookies() (phantompy.context.Context method), 9
clear_memory_caches() (phantompy.context.Context method), 10
conf (phantompy.context.Context attribute), 10
Config (class in phantompy.context), 9
Context (class in phantompy.context), 9
context() (in module phantompy.context), 10
cssselect() (phantompy.webelements.WebElement method), 10
cssselect_first() (phantompy.webelements.WebElement method), 11

D

destroy_context() (in module phantompy.context), 10

F

frame (phantompy.webelements.WebElement attribute), 11

G

get_all_cookies() (phantompy.context.Context method), 10
get_attr() (phantompy.webelements.WebElement method), 11
get_attrs() (phantompy.webelements.WebElement method), 11
get_classes() (phantompy.webelements.WebElement method), 11

H

has_attr() (phantompy.webelements.WebElement method), 11

hasAttrs() (phantompy.webelements.WebElement method), 11
has_class() (phantompy.webelements.WebElement method), 11

I

inner_html() (phantompy.webelements.WebElement method), 11
inner_text() (phantompy.webelements.WebElement method), 11
